Projektblatt U4 Wientalterasse

In 2014, a 70-metre long terrace and footbridge were erected in the area of the U4 Pilgramgasse station. We supported the entire construction phase and were responsible for continuous monitoring of the railway line with our DiMoSy monitoring system. DiMoSy controlled three tachymeters and one temperature sensor simultaneously. To show potential deformation, 15 profiles were defined for up to five points each that were measured at regular intervals.
